INTRODUCTION

The volume control button is a simple plastic button that increases or decreases the volume. This button is attached to the frame of the phone and activates the volume controlling circuitry on the motherboard when pressed.

-

Step 1 — Rear Cover

- To remove the rear cover, locate the tab indicated by the red outline.
- Using your fingernail, gently pry the rear cover.

Step 2 — Battery

⚠ Turn off the phone before removing battery.

- The battery can be removed from the phone by applying an upwards pressure to the bottom right edge of the battery, as indicated by the red rectangle.
- After the battery starts to lift upwards, use your hand to hold and remove it.

Step 3 — SIM Card

- The SIM card is the small white rectangle located in the red rectangle.
- To remove the SIM card, press down on the card and slide it to the left, until it no longer is in contact with the metal.

Step 4 — Media Card

- The media card is found inside the area indicated with the red rectangle. The card itself is small and black making it hard to easily see.
- After locating the card, gently use your fingers to slide the card to the right, until the card is no longer in contact with the metal.

Step 5 — Inner Plate

- The inner plate is held on by six screws that are 1/16 of an inch (1.6 mm).
- Remove the screws with a Philips head precision screwdriver.
- Place all screws somewhere that they will not easily be lost, such as a magnetic mat or a plastic bag.

Step 6

 When removing the inner plate, place device on grounded surface or use anti static wrist band.

- After the screws have been removed, the only thing holding the inner plate in is several plastic tabs built into the frame of the phone.
- Firmly pinch the edge, as shown in the picture, and pull the plate away from the frame.
- If you cannot get a grip on the inner plate, consider using the spudger to pry and lift the plate out.

Step 7 — Motherboard

 The motherboard holds many delicate components, improper handling can result in the destruction of these components.

- To remove the motherboard, first undo the three tabs, indicated by the red outlines, using either a small flat-head screwdriver or your thumbnail.
- In addition to the three at the top of the motherboard, there is a fourth tab at the bottom of the phone that will need to be opened as well.

Step 8

- After all the tabs are unplugged, carefully apply pressure to the edges of the motherboard and lift upwards.
- If the motherboard does not lift up, you may need to wiggle it left and right to free the corners from the areas where the case screws were placed.

Step 9 — Volume Control Button

- Lift the tab indicated by the red rectangle using a pair of tweezers.

Step 10

- After the tab has been lifted press the volume control button inwards until it is free of the frame.
- A pair of tweezers could be used to help aid in removing the volume control button from the frame.

To reassemble your device, follow these instructions in reverse order.
